Executive Summary

In Alberta, forest managers use merchantable timber volume criteria for stand volume assessment, yield curve development, timber supply calculations, and annual allowable cut determination. Utilization standards specify the minimum dimensions of trees to be used in the merchantable volume calculation. Since utilization standards vary for different mills, species, or are changed from time to time, a set of conversions among various standards is required. This is particularly important for the Reforestation Standard of Alberta (RSA), which requires a single utilization standard for reporting purposes. Mean annual increment (MAI) targets for broad cover group or base-10 composition strata obtained from forest management plans need to be converted to the RSA utilization standard. This allows comparison of the projected MAI obtained from a performance survey in a regenerating stand with the MAI goal for this stand, derived from the Forest Management Plan. Adjustments to the allowable cut potentially resulting from over- or under-performance of regenerated openings will need to be converted back to company utilization standards. This report presents the analytical procedures and tables of conversion factors for all pairs of utilization standards that should be required in Alberta. The data underlying these conversions is tree data from provincial permanent sample plots compiled to stratum-level merchantable volume under a series of utilization standards.

1.0 Introduction

Utilization standards specify a set of minimum dimensions that trees of a given species or species group must satisfy before the trees can be included in merchantable volume estimation. In Alberta, utilization standards are set by specifying the minimum stump diameter measured outside the bark (SDOB) at a given stump height (STHT) and the minimum top diameter inside the bark (TDIB). The most common utilization standard in Alberta is 15cm SDOB, 10cm TDIB and 30 cm STHT, usually presented as: 15/10/30. In addition to the minimum SDOB/TDIB/STHT combination, minimum log length (MLL: distance from stump height to where the tree narrows to the top diameter specification) is often included in the criteria for utilization standards. These criteria are imposed to avoid including the volumes of trees that have a merchantable length too short to process into certain products, e.g. lumber. One final component of a utilization standard is the processing methodology employed. There are two types of processing discussed in this report: tree length and cut to length. In tree length (TL) processing the entire merchantable length from STHT to TDIB is counted toward the estimation or merchantable volume. In cut-to-length (CTL) processing, a target log length is used to determine how much of the merchantable stem is used. For each stem, the maximum number of full logs that meet the target log length criteria is counted toward merchantable volume. Any remaining sections of the stem that are shorter than the target length are considered waste and do not contribute to merchantable volume. Some processors further optimize CTL by determining the mix of log lengths (e.g. the same tree could be cut into some 244, some 366 and some 488 cm logs) which maximize the value of each tree. However, this complexity was deemed beyond the scope of this report and compilations for CTL processing were kept to a constant log length. The choice of a specific utilization standard as the basis for an annual allowable cut (AAC) calculation is usually determined by the type of products a company produces (e.g. pulp or lumber) and the ability of the company to efficiently process harvested logs of a given dimension.

Since May 1, 2009, the Reforestation Standard of Alberta (RSA) has required an estimate of the future productivity of each regenerated stand after a performance survey at age 11-14 years. The future productivity estimate is the modeled mean annual increment (MAI) at deciduous or coniferous culmination (depending on the landbase designation), based on a 15/10/30/TL utilization standard with 366 cm minimum log length. This is compared to the target MAI obtained from the yield curve for the same stratum in the company Forest Management Plan (FMP). Since companies may prepare their yield curves and timber supply analysis (TSA) using other utilization standards, conversion factors are required to convert the MAI based on the company standard to the MAI for the RSA standard. ESRD policy also allows for a Quadrant Adjusted Cut (QAC) to be periodically applied, based on the cumulative outcome of comparisons of MAI standards to several years of performance survey MAI estimates. To be meaningful to the company, the QAC based on the RSA standard will need to be converted to the company standard.

Utilization conversion factors may be also used to estimate the impact of changing a company utilization standard to implement new products or access additional timber (e.g. mountain pine

beetle salvage). Steps taken to support a utilization standard amendment must be consistent with current ESRD policies. Conversion factors provided in this report may be used to provide a preliminary estimate of the potential impact associated with utilization standard amendments.

The purpose of this paper is to provide provincial estimates of utilization standard conversion factors that allow inter-conversion among the majority of current and anticipated utilization standards in Alberta.

2.0 Methodology

2.1 Stratification and Data

The amount by which merchantable volume changes in response to changes in utilization standards is primarily determined at the tree level by the bole taper, and at the stand level by the size distribution, with respect to DBH and height, of the stems. All tree and stand factors that influence absolute size, tree taper or stand structure will impact the change in merchantable volume following a change in utilization standards. Stand age, species composition, stem density, site quality and climate all affect utilized volume changes at both the individual tree and the stand level. It is important to consider these factors in choosing and stratifying the data for determining volume conversion factors.

The provincial mature stand permanent sample plot (PSP) data were used for this exercise. These plots were established from 1960 to 1992 primarily in stands older than 40 years (Tables 1 and 2). These plots are well-distributed across most of the forested area of Alberta. They are near or past culmination of MAI and contain trees near to well-over merchantable size, which is the size range where conversions among utilization standards exhibit differences. Young stands have no merchantable volume at all; therefore most juvenile PSP data is not useful for this exercise. The age of the PSPs was evaluated (Tables 1 and 2) to confirm their suitability, however since most are near or past typical culmination age for MAI, all data was used.

The Alberta Forest Management Planning Standard (Version 4.1, April 2006) defines a minimum of ten stand-level species composition strata (1-D, 2-DC-Sx, 3-DC-Pl, 4-CD-Sw, 5-CD-Pl, 6-CD-Sb, 7-C-Sw, 8-C-Pl, 9-C-Sb, and 10-C-Fd¹) nested within four broad cover groups (BCG: D, DC, CD, C¹) for yield projections and reforestation standards. These volume conversion factors were calculated based on these Base-10 strata and on the BCG strata. However, there were no PSPs in black spruce – hardwood (6-CD-Sb) stands, and very few in Douglas-fir (10-C-Fd) stands; hence these strata do not appear in this report. In mixed softwood-hardwood stands, black spruce closely resembles white spruce in its growth dynamics; similarly Douglas-fir is most similar to white spruce. We therefore recommend using the conversions from stratum 4-CD-Sw for 6-CD-Sb stands, and the conversions from stratum 7-C-Sw for 10-C-Fd stands.

¹Base-10 species codes are D = deciduous hardwood species, P = pine species, Sx = spruce species, Sw = white spruce, Sb = black spruce, Fd = Douglas-fir. Broad cover group codes are D = Deciduous stands, DC = Deciduous leading mixedwoods, CD = conifer leading mixedwoods, C = conifer stands;

Two broad classes of natural region, Boreal and Foothills, were also used to reflect climatic differences, due to latitude (north-south) and elevation (western foothills vs eastern plains). The component natural sub-regions of the boreal and the foothills natural regions are listed in Table 3. The final stratification used in this report was by these two natural region groups, then either by the base-10 species composition strata (with 7-CD-Sb and 10-C-Fd excluded) or by the BCG strata.

It is important to note that the conversions obtained represent the averages within these strata. The conversion factors may not be suitable for converting volume measures from trees which are not representative of their stratum. These should not be applied to graded or sorted logs or a population of stands from a single extreme natural subregion (subalpine), for example.

Table 1. Count of all permanent sample plot (PSP) measurements used for calculating volume conversion factors by stratum and 40-year age class. These are not plot counts, but rather the count of all re-measurements ¹

Species composition	40-year Age Class								Total
	<40	40-80	80-120	120-160	160-200	200-240	240-280	280-320

Foothills	7-Alpine	10-Upper Foothills
	8-Sub-Alpine	11-Lower Foothills
	9-Montane	

2.2 Data compilation

Merchantable volumes were compiled first on an individual tree basis using the taper equations, sub-regional parameters, and integration methods outlined in Huang (1994)³. The volumes of live trees were then summed and expanded to a stand volume per hectare basis. Deciduous and coniferous volumes were calculated separately. Exactly the same data was used for calculating the average volume for each utilization standard. The PSP data were compiled to various combinations of SDOB, TDIB and STHT, MLL, and processing type (TL vs. CTL) previously observed or anticipated. The resulting matrix of utilization standards that were compiled may not cover all combinations of future standards but represented a reasonable coverage of current and anticipated standards. Missing intermediate standards could be reasonably estimated by interpolating between higher and lower standards.

The following standards were used for each of the criteria:

STHT (cm)

- 10, 15, 20, 25, 30

MLL (cm)

- 0, 244, 366, 488

- Cut to length (CTL): 366 cm (12 ft) log lengths
- Cut to length (CTL): 488 cm (16 ft) log lengths

2.3 Calculating conversion factors

A volume conversion factor potentially could convert an average volume of wood at the individual tree, stand, stratum or FMA level from one utilization standard to another. In most applications, conversion factors will be used at the stratum or FMA/FMU level.

The volume conversion factors are expressed with the average volume of the target¹ utilization standard (V_{TUS}) as a ratio (CF) of the average volume of the base utilization standard (V_{BUS}):

$$CF = \frac{V_{TUS}}{V_{BUS}} \quad (1)$$

Where: V_{TUS} is the average volume of the target utilization standard (TUS),

V_{BUS} is the base utilization standard (BUS), and

CF is the volume conversion factor.

¹ The base utilization standard (BUS) is the current or existing utilization standard used to calculate merchantable volume. The target utilization standard (TUS) on the other hand is the new merchantability standard we wish to convert to.

From Equation 1, if V_{TUS} is desired, then V_{BUS} is multiplied by CF. The reverse is also possible: if V_{BUS} is desired, then V_{TUS} is divided by CF.

In theory, these ratios can be calculated at the individual tree level, plot level, at the stand level or stratum level. In practice, however, calculating conversion factors at the tree and plot levels using equation 1 above will exclude the contribution of trees or plots when individual trees are too small to have any volume at a given merchantability specification. Such cases would involve computing ratios with zero volumes, which requires careful consideration of the data to avoid divide by zero errors. Averaging the volume at the stratum level before calculating the conversion factors eliminates these problems.

In this exercise, utilization conversion factors were calculated by averaging the volumes in the PSPs at the natural region and strata level before computing the volume ratios. Average volume per hectare for conifer and deciduous species were calculated for each stratum and their conversion factors computed using Equation 1. Conversion factors were calculated separately for conifer and deciduous species, for all combinations of utilization standards (SDOB, TDIB) highlighted in Table 4, stump heights from 5 to 30 cm in increments of 5 cm, and processing type-MLL combinations (TL366, CTL244, CTL366, CTL488), by the 10 provincial base strata (excluding 6-CD-Sb and 10-C-Fd) as well as the broad cover group strata, and by the two natural region groups (Boreal vs. Foothills). Conversions among minimum log length (MLL) standards within TL processing were also evaluated (see Results below), but found to have minor effects.

3.0 Results

3.1 *Minimum Merchantable Length for Tree-Length Processing*

The impact of minimum merchantable length on volume conversion factors was examined first. Average stratum-level volumes for selected utilization standards were used to calculate factors for converting volumes amongst the four minimum merchantable lengths compiled in this exercise (0, 244, 366 and 488 cm). The zero MLL includes logs of all lengths meeting the other (SDOB, TDIB, STHT) criteria. Each of the computed factors were then compared at the stratum level to a conversion of 1.000 to decide if converting volume between any pair of minimum log lengths would result in a significant change in merchantable volume. The results are presented in appendices A1 to A4 for the 13/7/30, 15/10/30, 15/11/30 and 10/8/30 TL utilization standards, respectively. The objective was to decide if creating volume conversion factors for all minimum log length categories was necessary. These tables, for tree-length processing, show the differences are generally very small (conversion factors near 1.000). The largest differences were found for the most inclusive utilization standard (10/8/30) in the black spruce (C-Sb) stratum: for conifer volume, conversions could be as large as 10% different from 1.000 (1.100 for converting from a MLL of 488 cm to a MLL of zero, or 0.909 for the reverse conversion). Also, for deciduous volume in this stratum, the largest conversion was 1.5% different from 1.000 (1.015 for 488 cm to zero MLL or 0.985 for the reverse). However, conversions between such different standards would be rarely applied, and only a very small area in the C-Sb stratum is managed in the province. Therefore, the tables of conversion factors for tree-length

processing were generated for only the 366 cm minimum merchantable length. This is the minimum log length used in the growth projection system GYPSY (Huang et al. 2009)¹, in the RSA standard, and the most frequently used minimum log length in forest management plans. Due to the waste ends, the choice of MLL had a larger effect for CTL-processed trees; therefore separate conversions should be looked up for changing the MLL with any CTL specification.

3.2 Conversion factors for Tree-Length and Cut-to-Length Processing

A comprehensive look-up table of conversion factors covering 2600 possible utilization standards (65 shaded combinations in Table 4 \times 5 stump heights \times 4 processing types (TL366, CTL244, CTL366, CTL488) \times 2 regions), as well as smaller printable tables covering the current and possible utilization standards used in forest management planning (“x” and “p” combinations; Table 4) for tree-length processing and a 366 cm MML were generated. The smaller tables are provided in Appendix B-E of this report. The comprehensive look-up table was saved with a locked database of average merchantable volumes in each natural region and stratum. A simple Microsoft® Excel spreadsheet-based lookup tool was developed for generating conversion factors based on these volumes (“AESRD-FMB-UtilizationStandardConversionTool.xls”). This tool can be obtained from the ESRD Forest Management Growth and Yield Reports and Tools page, or by searching “Utilization Standard Conversions” from the Alberta government website.

Appendix B presents the subset of tree-length conversion factors for Base-10 strata in the Boreal natural region for conifer and deciduous species. Appendix C presents similar conversions for the Foothills natural region. Appendices D-E present conversions for tree-length conversions in Broad Cover Groups (BCG) in the Boreal and Foothills natural regions, respectively. The tables are indexed first by Natural Region, then by species type (Conifer vs. Deciduous), then by the specific base-10 or BCG stratum, and lastly by stump height combinations. Rows and columns within each table list the SDOB/TDIB combinations, with stump height also indicated for clarity. In many cases, the user can look up any standard to convert from in the column labelled “A”, find the standard to convert to in the row labelled “B”, then obtain the conversion factor by tracing down this row and column to their intersection.

For example, if the desire is to convert volume from a 13/7/15 utilization standard to a 15/10/30 for a boreal white spruce (7-C-Sw) stratum:

- 1) The Boreal tables occur on pages B1-B64. Conversions for conifer volume are on pages B1-B32 and for deciduous volume are on page B33-64.
- 2) The stratum is 7-C-Sw, which is on pages B21-B24 for conifer conversions, B53-B56 for deciduous conversions.
- 3) Tables for stump height (STHT) conversions from 15 to 30cm, are on page B22 for conifers and B54 for deciduous conversions.

¹ Huang, S, S. Meng and Y. Yang. 2009. A Growth and Yield Projection System (GYPSY) for Natural and Post-Harvest Stands in Alberta. Alberta Sustainable Resource Development, Forestry Division. Edmonton, Alberta.

4) The current base 13/7/15 standard is on the 9th row going down column A. The desired 15/10/30 standard is near the centre of row B (17th column). Tracing down from 15/10/30 and across from 13/7/15 on Tables B22 and B56, the conversion factor for conifer volumes is 0.936, and for deciduous volumes, 0.946

5) To convert the volume under the current standard to the desired one, multiply the volume by the correct conversion factor:

For conifer species, this would be

Conifer volume under standard B = Conifer volume under standard A \times 0.936

For deciduous species, this would be

Deciduous volume under standard B = Deciduous volume under standard A \times 0.946

6) The conversion factors can also be used in reverse. If you had to convert the other way (you had standard A as 15/10/30 and needed standard B as 13/7/15), you could divide the current volume by the conversion factor (or multiply by the inverse of the conversion factor), i.e.

For conifers,

Conifer Volume under standard A = Conifer Volume under standard B \div 0.936

or, Conifer Volume under standard A = Conifer Volume under standard B \times 1 / 0.936
= Conifer Volume under standard B \times 1.068

For deciduous,

Deciduous Volume under standard A = Deciduous Volume under standard B \div 0.946

or, Deciduous Volume under standard A = Deciduous Volume under standard B \times 1 / 0.946
= Deciduous Volume under standard B \times 1.057

The tables in this report allow conversions between any pair of standards using the conversion factors as multipliers (as opposed to divisors). You can look up most combinations of current standard from column A and desired standard from row B, then multiply volume by the conversion factor. However, not all combinations are compiled in these tables to reduce the bulk of this report. For other specifications not listed in these tables, but within the shaded combinations shown in Table 4, and for Cut-to-length conversions, use the downloadable Microsoft® Excel lookup tool ("AESRD-FMB-UtilizationStandardConversionTool.xls").

7) Note that any volume measure (stand or strata volume, MAI, AAC) can be converted using these tables, as long as the volume measure is from trees that are representative of the stratum (i.e. no sorting or selection into age, size or sub-regional classes).

Appendix A

Effect of Minimum Log Length on Utilization Conversion Factors for Tree-Length Standards

Table A1. Volume conversion factors for 13/7/30 tree-length utilization among 0, 244, 366 and 488 cm minimum log lengths.

Stratum	Min. Log Length (cm)	Conifer				Deciduous			
		Min. Log Length (cm)				Min. Log Length (cm)			
		0	244	366	488	0	244	366	488

Appendix B

Utilization Conversion Factors for Tree-Length Processing in the Boreal Natural Region by Base-10 Stratum for Conifer and Deciduous Species

Table B1. Boreal Hardwood Stratum. Conversions for Conifer species from tree-length standards with stump heights of 15 to 15 cm.

Choose the two utilization standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply volume by the conversion factor

To convert from standard B to A, divide volume by the conversion factor

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B3. Boreal Hardwood Stratum. Conversions for Conifer species from tree-length standards with stump heights of 30 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
Base-10 Stratum 1-D
STHT 30-15
Conifers**

Standard ←A B↓	To convert from standard B to A, divide by the conversion factor

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

**Boreal
Base-10 Stratum 1-D
STHT 30-30
Conifers**

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

Standard ←A B↓	←B A↓

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B7. Boreal Hardwood-Pine Stratum. Conversions for Conifer species from tree-length standards with stump heights of 30 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
Base-10 Stratum 2-DC-P
STHT 30-15
Conifers**

Standard A ↓ B ↓

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B8. Boreal Hardwood-Pine Stratum. Conversions for Conifer species from tree-length standards with stump heights of 30 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
Base-10 Stratum 2-DC-P
STHT 30-30
Conifers**

Standard A ↓ B ↓	To convert from standard B to A, divide by the conversion factor

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B9. Boreal Hardwood-Spruce Stratum. Conversions for Conifer species from tree-length standards with stump heights of 15 to 15 cm

Boreal

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Base-10 Stratum 3-DC-Sx

Find the conversion factor at the intersection of the row and column

STHT 15-15

To convert from standard A to B, multiply by the conversion factor

Conifers

To convert from standard B to A, divide by the conversion factor

Standard A ↓ B ↓

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B11. Boreal Hardwood-Spruce Stratum. Conversions for Conifer species from tree-length standards with stump heights of 30 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
Base-10 Stratum 3-DC-Sx
STHT 30-15
Conifers**

B11

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B12. Boreal Hardwood-Spruce Stratum. Conversions for Conifer species from tree-length standards with stump heights of 30 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
Base-10 Stratum 3-DC-Sx
STHT 30-30
Conifers**

B12

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor
For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B15. Boreal White Spruce-Hardwood Stratum. Conversions for Conifer species from tree-length standards with stump heights of 30 to 15 cm **Boreal**
Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B **Base-10 Stratum 4-CD-Sw**
Find the conversion factor at the intersection of the row and column **STHT 30-15**
To convert from standard A to B, multiply by the conversion factor **Conifers**
To convert from standard B to A, divide by the conversion factor

Standard A ↓ B ↓

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B16. Boreal White Spruce-Hardwood Stratum. Conversions for Conifer species from tree-length standards with stump heights of 30 to 30 cm **Boreal**
Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B **Base-10 Stratum 4-CD-Sw**
Find the conversion factor at the intersection of the row and column **STHT 30-30**
To convert from standard A to B, multiply by the conversion factor **Conifers**
To convert from standard B to A, divide by the conversion factor

B16

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B19. Boreal Pine-Hardwood Stratum. Conversions for Conifer species from tree-length standards with stump heights of 30 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
Base-10 Stratum 5-CD-P
STHT 30-15
Conifers**

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B20. Boreal Pine-Hardwood Stratum. Conversions for Conifer species from tree-length standards with stump heights of 30 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
Base-10 Stratum 5-CD-P
STHT 30-30
Conifers**

B20

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B21. Boreal White Spruce Stratum. Conversions for Conifer species from tree-length standards with stump heights of 15 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
Base-10 Stratum 7-C-Sw
STHT 15-15
Conifers**

B21

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B24. Boreal White Spruce Stratum. Conversions for Conifer species from tree-length standards with stump heights of 30 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
Base-10 Stratum 7-C-Sw
STHT 30-30
Conifers**

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B25. Boreal Pine Stratum. Conversions for Conifer species from tree-length standards with stump heights of 15 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

Boreal
Base-10 Stratum 8-C-P
STHT 15-15
Conifers

B25

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B26. Boreal Pine Stratum. Conversions for Conifer species from tree-length standards with stump heights of 15 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

Boreal
Base-10 Stratum 8-C-P
STHT 15-30
Conifers

B26

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B29. Boreal Black Spruce Stratum. Conversions for Conifer species from tree-length standards with stump heights of 15 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
Base-10 Stratum 9-C-Sb
STHT 15-15

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B30. Boreal Black Spruce Stratum. Conversions for Conifer species from tree-length standards with stump heights of 15 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
Base-10 Stratum 9-C-Sb
STHT 15-30
Conifers**

B30

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B31. Boreal Black Spruce Stratum. Conversions for Conifer species from tree-length standards with stump heights of 30 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
Base-10 Stratum 9-C-Sb
STHT 30-15
Conifers**

B31

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B34. Boreal Hardwood Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

Boreal
Base-10 Stratum 1-D
STHT 15-30
Deciduous

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B35. Boreal Hardwood Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

Boreal
Base-10 Stratum 1-D
STHT 30-15
Deciduous

B35

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B36. Boreal Hardwood Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

Boreal
Base-10 Stratum 1-D
STHT 30-30
Deciduous

B36

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B39. Boreal Hardwood-Pine Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
Base-10 Stratum 2-DC-P
STHT 30-15
Deciduous**

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B40. Boreal Hardwood-Pine Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
Base-10 Stratum 2-DC-P
STHT 30-30
Deciduous**

B40

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B41. Boreal Hardwood-Spruce Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
Base-10 Stratum 3-DC-Sx
STHT 15-15
Deciduous**

B41

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B44. Boreal Hardwood-Spruce Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
Base-10 Stratum 3-DC-Sx
STHT 30-30
Deciduous**

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B45. Boreal White Spruce-Hardwood Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 15 cm **Boreal**

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Base-10 Stratum 4-CD-Sw

Find the conversion factor at the intersection of the row and column

STHT 15-15

To convert from standard A to B, multiply by the conversion factor

Deciduous

To convert from standard B to A, divide by the conversion factor

B45

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B46. Boreal White Spruce-Hardwood Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 30 cm **Boreal**

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Base-10 Stratum 4-CD-Sw

Find the conversion factor at the intersection of the row and column

STHT 15-30

To convert from standard A to B, multiply by the conversion factor

Deciduous

To convert from standard B to A, divide by the conversion factor

B46

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B49. Boreal Pine-Hardwood Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
Base-10 Stratum 5-CD-P
STHT 15-15
Deciduous**

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B50. Boreal Pine-Hardwood Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
Base-10 Stratum 5-CD-P
STHT 15-30
Deciduous**

B50

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B51. Boreal Pine-Hardwood Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
Base-10 Stratum 5-CD-P
STHT 30-15
Deciduous**

B51

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B54. Boreal White Spruce Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

Boreal
Base-10 Stratum 7-C-Sw

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B55. Boreal White Spruce Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

Boreal
Base-10 Stratum 7-C-Sw
STHT 30-15
Deciduous

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B56. Boreal White Spruce Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

Boreal
Base-10 Stratum 7-C-Sw
STHT 30-30
Deciduous

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B59. Boreal Pine Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

Boreal
Base-10 Stratum 8-C-P
STHT 30-15

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B60. Boreal Pine Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

Boreal
Base-10 Stratum 8-C-P
STHT 30-30
Deciduous

09B

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B61. Boreal Black Spruce Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 15 cm

Boreal

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Base-10 Stratum 9-C-Sb

Find the conversion factor at the intersection of the row and column

STHT 15-15

To convert from standard A to B, multiply by the conversion factor

Deciduous

To convert from standard B to A, divide by the conversion factor

B61

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B62. Boreal Black Spruce Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 30 cm

Boreal

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Base-10 Stratum 9-C-Sb

Find the conversion factor at the intersection of the row and column

STHT 15-30

To convert from standard A to B, multiply by the conversion factor

Deciduous

To convert from standard B to A, divide by the conversion factor

B62

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table B64. Boreal Black Spruce Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 30 cm

Boreal

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Base-10 Stratum 9-C-Sb

Find the conversion factor at the intersection of the row and column

STHT 30-30

To convert from standard A to B, multiply by the conversion factor

Deciduous

To convert from standard B to A, divide by the conversion factor

B64

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Appendix C

Utilization Conversion Factors for Tree-Length Processing in the Foothills Natural Region by Base-10 Stratum for Conifer and Deciduous Species

Table C1. Foothills Hardwood Stratum. Conversions for Conifer species from tree-length standards with stump heights of 15 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Foothills
Base-10 Stratum 1-D
STHT 15-15
Conifers**

Standard ← A B ↓

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C2. Foothills Hardwood Stratum. Conversions for Conifer species from tree-length standards with stump heights of 15 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Foothills
Base-10 Stratum 1-D
STHT 15-30
Conifers**

3

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C5. Foothills Hardwood-Pine Stratum. Conversions for Conifer species from tree-length standards with stump heights of 15 to 15 cm

Foothills

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Base-10 Stratum 2-DC-P

Find the conversion factor at the intersection of the row and column

STHT 15-15

To convert from standard A to B, multiply by the conversion factor

Conifers

To convert from standard B to A, divide by the conversion factor

GC

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C6. Foothills Hardwood-Pine Stratum. Conversions for Conifer species from tree-length standards with stump heights of 15 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Foothills
Base-10 Stratum 2-DC-P
STHT 15-30
Conifers**

30

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C7. Foothills Hardwood-Pine Stratum. Conversions for Conifer species from tree-length standards with stump heights of 30 to 15 cm

Foothills

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Base-10 Stratum 2-DC-P

Find the conversion factor at the intersection of the row and column

STHT 30-15

To convert from standard A to B, multiply by the conversion factor

Conifers

To convert from standard B to A, divide by the conversion factor

↕

Standard A ↓ B ↓	08/04/15	08/06/15	10/06/15	10/07/15	10/08/15	12/06/15	12/08/15	12/09/15	13/07/15	13/08/15	13/09/15	13/10/15	14/09/15	14/10/15	14/11/15	15/09/15	15/10/15	15/11/15	15/12/15	15/13/15	16/10/15	16/11/15	16/12/15	16/13/15	16/14/15	18/13/15	18/14/15	18/15/15	20/16/15	20/17/15

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C9. Foothills Hardwood-Spruce Stratum. Conversions for Conifer species from tree-length standards with stump heights of 15 to 15 cm

Foothills

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Base-10 Stratum 3-DC-Sx

Find the conversion factor at the intersection of the row and column

STHT 15-15

To convert from standard A to B, multiply by the conversion factor

Conifers

To convert from standard B to A, divide by the conversion factor

60

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C10. Foothills Hardwood-Spruce Stratum. Conversions for Conifer species from tree-length standards with stump heights of 15 to 30 cm

Foothills

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Base-10 Stratum 3-DC-Sx

Find the conversion factor at the intersection of the row and column

STHT 15-30

To convert from standard A to B, multiply by the conversion factor

Conifers

To convert from standard B to A, divide by the conversion factor

C10

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C11. Foothills Hardwood-Spruce Stratum. Conversions for Conifer species from tree-length standards with stump heights of 30 to 15 cm

Foothills

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Base-10 Stratum 3-DC-Sx

Find the conversion factor at the intersection of the row and column

STHT 30-15

To convert from standard A to B, multiply by the conversion factor

Conifers

To convert from standard B to A, divide by the conversion factor

C11

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C12. Foothills Hardwood-Spruce Stratum. Conversions for Conifer species from tree-length standards with stump heights of 30 to 30 cm

Foothills

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Base-10 Stratum 3-DC-Sx

Find the conversion factor at the intersection of the row and column

STHT 30-30

To convert from standard A to B, multiply by the conversion factor

Conifers

To convert from standard B to A, divide by the conversion factor

C12

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C14. Foothills White Spruce-Hardwood Stratum. Conversions for Conifer species from tree-length standards with stump heights of 15 to 30 cm **Foothills**
Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B
Base-10 Stratum 4-CD-Sw
Find the conversion factor at the intersection of the row and column
STHT 15-30
To convert from standard A to B, multiply by the conversion factor
Conifers
To convert from standard B to A, divide by the conversion factor

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

To convert from standard B to A, divide by the conversion factor

C15

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C16. Foothills White Spruce-Hardwood Stratum. Conversions for Conifer species from tree-length standards with stump heights of 30 to 30 cm **Foothills**
Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B
Base-10 Stratum 4-CD-Sw
Find the conversion factor at the intersection of the row and column
STHT 30-30
To convert from standard A to B, multiply by the conversion factor
Conifers
To convert from standard B to A, divide by the conversion factor

Standard A ↓ B ↓

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C19. Foothills Pine-Hardwood Stratum. Conversions for Conifer species from tree-length standards with stump heights of 30 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Foothills
Base-10 Stratum 5-CD-P
STHT 30-15
Conifers**

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C20. Foothills Pine-Hardwood Stratum. Conversions for Conifer species from tree-length standards with stump heights of 30 to 30 cm

Foothills

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Base-10 Stratum 5-CD-P

Find the conversion factor at the intersection of the row and column

STHT 30-30

To convert from standard A to B, multiply by the conversion factor

Conifers

To convert from standard B to A, divide by the conversion factor

C20

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C21. Foothills White Spruce Stratum. Conversions for Conifer species from tree-length standards with stump heights of 15 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Foothills
Base-10 Stratum 7-C-Sw
STHT 15-15
Conifers**

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C24. Foothills White Spruce Stratum. Conversions for Conifer species from tree-length standards with stump heights of 30 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Foothills
Base-10 Stratum 7-C-Sw
STHT 30-30

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C25. Foothills Pine Stratum. Conversions for Conifer species from tree-length standards with stump heights of 15 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Foothills
Base-10 Stratum 8-C-P
STHT 15-15
Conifers**

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C26. Foothills Pine Stratum. Conversions for Conifer species from tree-length standards with stump heights of 15 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Foothills
Base-10 Stratum 8-C-P
STHT 15-30
Conifers**

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C29. Foothills Black Spruce Stratum. Conversions for Conifer species from tree-length standards with stump heights of 15 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Foothills
Base-10 Stratum 9-C-Sb
STHT 15-15

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C30. Foothills Black Spruce Stratum. Conversions for Conifer species from tree-length standards with stump heights of 15 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

Foothills
Base-10 Stratum 9-C-Sb
STHT 15-30
Conifers

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C31. Foothills Black Spruce Stratum. Conversions for Conifer species from tree-length standards with stump heights of 30 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Foothills
Base-10 Stratum 9-C-Sb
STHT 30-15
Conifers**

C31

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C34. Foothills Hardwood Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Foothills
Base-10 Stratum 1-D
STHT 15-30

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C35. Foothills Hardwood Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Foothills
Base-10 Stratum 1-D
STHT 30-15
Deciduous**

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C36. Foothills Hardwood Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Foothills
Base-10 Stratum 1-D
STHT 30-30
Deciduous**

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C39. Foothills Hardwood-Pine Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 15 cm

Foothills

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Base-10 Stratum 2-DC-P

Find the conversion factor at the intersection of the row and column

STHT 30-15

To convert from standard A to B, multiply by the conversion factor

Deciduous

To convert from standard B to A, divide by the conversion factor

C39

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C40. Foothills Hardwood-Pine Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 30 cm

Foothills

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Base-10 Stratum 2-DC-P

Find the conversion factor at the intersection of the row and column

STHT 30-30

To convert from standard A to B, multiply by the conversion factor

Deciduous

To convert from standard B to A, divide by the conversion factor

C40

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C41. Foothills Hardwood-Spruce Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 15 cm **Foothills**
Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B **Base-10 Stratum 3-DC-Sx**
Find the conversion factor at the intersection of the row and column **STHT 15-15**
To convert from standard A to B, multiply by the conversion factor **Deciduous**
To convert from standard B to A, divide by the conversion factor

C41

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C42. Foothills Hardwood-Spruce Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 30 cm

Foothills

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Base-10 Stratum 3-DC-Sx

Find the conversion factor at the intersection of the row and column

STHT 15-30

To convert from standard A to B, multiply by the conversion factor

Deciduous

To convert from standard B to A, divide by the conversion factor

C42

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C44. Foothills Hardwood-Spruce Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 30 cm **Foothills**
Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B **Base-10 Stratum 3-DC-Sx**
Find the conversion factor at the intersection of the row and column **STHT 30-30**
To convert from standard A to B, multiply by the conversion factor **Deciduous**
To convert from standard B to A, divide by the conversion factor

C44

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C45. Foothills White Spruce-Hardwood Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 15 cm Foothills

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Base-10 Stratum 4-CD-Sw

Find the conversion factor at the intersection of the row and column

STHT 15-15

To convert from standard A to B, multiply by the conversion factor

Deciduous

To convert from standard B to A, divide by the conversion factor

C45

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C46. Foothills White Spruce-Hardwood Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 30 cm Foothills

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Base-10 Stratum 4-CD-Sw

Find the conversion factor at the intersection of the row and column

STHT 15-30

To convert from standard A to B, multiply by the conversion factor

Deciduous

To convert from standard B to A, divide by the conversion factor

C46

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C48. Foothills White Spruce-Hardwood Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 30 cm Foothills

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Base-10 Stratum 4-CD-Sw

Find the conversion factor at the intersection of the row and column

STHT 30-30

To convert from standard A to B, multiply by the conversion factor

Deciduous

To convert from standard B to A, divide by the conversion factor

C48

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C49. Foothills Pine-Hardwood Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Foothills
Base-10 Stratum 5-CD-P
STHT 15-15
Deciduous**

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C50. Foothills Pine-Hardwood Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 30 cm

Foothills

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Base-10 Stratum 5-CD-P

Find the conversion factor at the intersection of the row and column

STHT 15-30

To convert from standard A to B, multiply by the conversion factor

Deciduous

To convert from standard B to A, divide by the conversion factor

C50

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C51. Foothills Pine-Hardwood Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 15 cm

Foothills

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Base-10 Stratum 5-CD-P

Find the conversion factor at the intersection of the row and column

STHT 30-15

To convert from standard A to B, multiply by the conversion factor

Deciduous

To convert from standard B to A, divide by the conversion factor

C51

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C53. Foothills White Spruce Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 15 cm**Foothills**

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Base-10 Stratum 7-C-Sw

Find the conversion factor at the intersection of the row and column

STHT 15-15

To convert from standard A to B, multiply by the conversion factor

Deciduous

To convert from standard B to A, divide by the conversion factor

C53

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C54. Foothills White Spruce Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Foothills
Base-10 Stratum 7-C-Sw
STHT 15-30
Deciduous**

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C55. Foothills White Spruce Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Foothills
Base-10 Stratum 7-C-Sw

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C58. Foothills Pine Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Foothills
Base-10 Stratum 8-C-P

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C59. Foothills Pine Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Foothills
Base-10 Stratum 8-C-P
STHT 30-15
Deciduous**

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C60. Foothills Pine Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Foothills
Base-10 Stratum 8-C-P
STHT 30-30
Deciduous**

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C61. Foothills Black Spruce Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C63. Foothills Black Spruce Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Table C64. Foothills Black Spruce Stratum. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Foothills
Base-10 Stratum 9-C-Sb
STHT 30-30
Deciduous**

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

Appendix D

Utilization Conversion Factors for Tree-Length Processing in the Boreal Natural Region by BCG Stratum for Conifer and Deciduous Species

Table D1. Boreal Deciduous BCG*. Conversions for Conifer species from tree-length standards with stump heights of 15 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
BCG* D
STHT 15-15
Conifers**

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table D4. Boreal Deciduous BCG*. Conversions for Conifer species from tree-length standards with stump heights of 30 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table D5. Boreal Deciduous-led Mixedwood BCG*. Conversions for Conifer species from tree-length standards with stump heights of 15 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
BCG* DC
STHT 15-15
Conifers**

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table D6. Boreal Deciduous-led Mixedwood BCG*. Conversions for Conifer species from tree-length standards with stump heights of 15 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
BCG* DC
STHT 15-30
Conifers**

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table D9. Boreal Conifer-led Mixedwood BCG*. Conversions for Conifer species from tree-length standards with stump heights of 15 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
BCG* CD
STHT 15-15
Conifers**

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table D12. Boreal Conifer-led Mixedwood BCG*. Conversions for Conifer species from tree-length standards with stump heights of 30 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
BCG* CD
STHT 30-30
Conifers**

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table D13. Boreal Conifer BCG*. Conversions for Conifer species from tree-length standards with stump heights of 15 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
BCG* C
STHT 15-15
Conifers**

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table D14. Boreal Conifer BCG*. Conversions for Conifer species from tree-length standards with stump heights of 15 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
BCG* C
STHT 15-30
Conifers**

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table D17. Boreal Deciduous BCG*. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table D18. Boreal Deciduous BCG*. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table D19. Boreal Deciduous BCG*. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
BCG* D

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table D22. Boreal Deciduous-led Mixedwood BCG*. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table D23. Boreal Deciduous-led Mixedwood BCG*. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
BCG* DC
STHT 30-15
Deciduous**

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table D24. Boreal Deciduous-led Mixedwood BCG*. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
BCG* DC
STHT 30-30
Deciduous**

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table D27. Boreal Conifer-led Mixedwood BCG*. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table D28. Boreal Conifer-led Mixedwood BCG*. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
BCG* CD
STHT 30-30
Deciduous**

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table D29. Boreal Conifer BCG*. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Boreal
BCG* C
STHT 15-15
Deciduous**

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table D32. Boreal Conifer BCG*. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Appendix E

Utilization Conversion Factors for Tree-Length Processing in the Foothills Natural Region by BCG Stratum for Conifer and Deciduous Species

Table E1. Foothills Deciduous BCG* Conversions for Conifer species from tree-length standards with stump heights of 15 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Foothills
BCG* D
STHT 15-15

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table E4. Foothills Deciduous BCG*. Conversions for Conifer species from tree-length standards with stump heights of 30 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table E7. Foothills Deciduous-led Mixedwood BCG*. Conversions for Conifer species from tree-length standards with stump heights of 30 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Foothills
BCG* DC
STHT 30-15

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table E10. Foothills Conifer-led Mixedwood BCG*. Conversions for Conifer species from tree-length standards with stump heights of 15 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table E11. Foothills Conifer-led Mixedwood BCG*. Conversions for Conifer species from tree-length standards with stump heights of 30 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Foothills
BCG* CD

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table E12. Foothills Conifer-led Mixedwood BCG*. Conversions for Conifer species from tree-length standards with stump heights of 30 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Foothills
BCG* CD

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table E15. Foothills Conifer BCG*. Conversions for Conifer species from tree-length standards with stump heights of 30 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table E16. Foothills Conifer BCG*. Conversions for Conifer species from tree-length standards with stump heights of 30 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table E17. Foothills Deciduous BCG*. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table E20. Foothills Deciduous BCG*. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table E21. Foothills Deciduous-led Mixedwood BCG*. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 15 cm Foothills

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**BCG* DC
STHT 15-15
Deciduous**

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table E22. Foothills Deciduous-led Mixedwood BCG*. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 30 cm Foothills

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

BCG* DC

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table E25. Foothills Conifer-led Mixedwood BCG*. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table E26. Foothills Conifer-led Mixedwood BCG*. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Foothills
BCG* CD
STHT 15-30

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table E27. Foothills Conifer-led Mixedwood BCG*. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table E30. Foothills Conifer BCG*. Conversions for Deciduous species from tree-length standards with stump heights of 15 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table E31. Foothills Conifer BCG*. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 15 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

**Foothills
BCG* C
STHT 30-15

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page

*Broad cover group

Table E32. Foothills Conifer BCG*. Conversions for Deciduous species from tree-length standards with stump heights of 30 to 30 cm

Choose the two standards (SDOB/TDIB/STHT) you wish to convert between, from column A and row B

Find the conversion factor at the intersection of the row and column

To convert from standard A to B, multiply by the conversion factor

To convert from standard B to A, divide by the conversion factor

Conversion factors were calculated assuming tree-length (TL) processing with a 366 cm minimum log length; the effect of MLL conversions under TL processing are minor

For a full set of conversions (other specifications or cut-to-length), use the "Provincial Utilization Conversions" tool available on the ESRD Forest Management web page
