Vapour Pressure Products include High and Low Vapour Pressure Products. High Vapour Pressure Products are liquid under atmospheric pressure, such as ethylene, propylene and some condensates. Low Vapour Pressure Products are separated products that are liquid under pressure, such as propane, ethane, butane, gasoline, fuel oil, diesel, aviation fuel and some condensates. Vapour pressure fluids are refined products that are going to the oilsands and ethane going to Joffre. Examples of what is carried are liquid natural gas condensates.
