

Highwood River Hazard Study

Study update notice

We would like to provide an update on the status of the Highwood River Hazard Study.

The multi-year study started in fall 2015 and we recognize there is tremendous interest in new flood mapping products.

Municipal review of draft flood inundation maps and related technical reports is complete. In response to feedback we received, revisions to hydraulic modelling and flood mapping are underway to incorporate and reflect the impact of new flood berms in the High River area. Future public engagement on revised draft reports and maps is planned, and we will provide an update when more information becomes available.

Internal review of draft flood hazard maps continues, and a new approach to mapping floodways and updating flood hazard maps is being implemented. The new approach will better balance flood adaptation and resilience priorities and provide expanded flood hazard information to enhance public safety and inform local decision-making. We are exploring future municipal review and public engagement opportunities for draft flood hazard mapping, and will provide an update when more information becomes available.

The Highwood River Hazard Study is being completed under the provincial Flood Hazard Identification Program, the goals of which include enhancement of public safety and reduction of future flood damages through the identification of river and flood hazards. The provincial study was co-funded through the federal National Disaster Mitigation Program.

Project background and study progress

The Highwood River Hazard Study assesses and identifies river-related hazards along 93 km of the Highwood River and 14 km of the Little Bow River, through Foothills County, High River, and Longview. The study extends from upstream of Longview to the Bow River confluence.

The main study components outlined below include new hydraulic modelling and flood mapping, but all deliverables support local emergency response and land-use planning needs.

- **Survey and base data collection** – Municipal review complete

Hydraulic models and flood maps require high-accuracy base data. Field surveys and LiDAR remote sensing were used to collect river and floodplain elevations, channel cross section data, bridge and culvert information, and dedicated flood control structure details.

- **Hydrology assessment** – Municipal review complete

The hydrology assessment estimates flows for a wide range of possible floods along the Highwood River, including the 1:2, 1:5, 1:10, 1:20, 1:35, 1:50, 1:75, 1:100, 1:200, 1:350, 1:500, 1:750, and 1:1000 floods. The analysis includes data from the 2013 flood. The analysis includes data from the 2013 flood.

- **Hydraulic river modelling** – Municipal review complete, revisions underway

A new hydraulic computer model of the river system was created using new survey data and modern tools. The model was calibrated using surveyed highwater marks from past floods to ensure that results for different floods are reasonable.

Revisions are underway to incorporate and reflect the impact of new flood berms in the High River area.

- **Flood inundation mapping** – Municipal review complete, revisions underway

Flood maps for thirteen different sized floods, based on the hydraulic model results and the hydrology assessment, have been produced. Flood inundation maps can be used for emergency response planning and to inform local infrastructure design. These maps identify areas of direct flooding and areas that could be flooded if local berms fail.

Revisions are underway to incorporate and reflect the impact of new flood berms in the High River area.

- **Flood hazard mapping** – Under internal review

Flood hazard mapping divides the 1:100 floodplain into floodway and flood fringe zones, to identify where flooding is deepest and most destructive. These maps can be used to help guide long-term development planning.

A new approach to mapping floodways and updating flood hazard maps is being implemented, including reflecting the protection provided by flood berms and providing information about a wider range of flood hazards.

- **Flood risk assessment and inventory** – Under internal review

An inventory of structures at risk of flooding for all of the mapped flood scenarios can support future flood damage assessments.

Flood risk statistics are being updated based on draft flood mapping changes.

- **Channel stability investigation** – Municipal review complete

This investigation provides insight into general channel stability along the Highwood River, and compares current and historic riverbank locations and channel cross sections as far back as 1949 using historic aerial photos.
