

## Rabies vaccination after exposure decision tree

\*\*Animals are considered unvaccinated until 14 days have elapsed since primary vaccination.

† Delays of greater than 96 hours (4 days) from exposure to vaccination can affect the need for or duration of confinement; however, vaccination should still be administered even if delayed past 96 hours.

Determining patient vaccination status must rely on documentation or verbal confirmation from a licensed veterinary clinic (e.g., vaccination certificate, medical records). Do not rely on owner report alone.
