Title: Hwy 63:06/08, S. of Marians Lake to N. of Mariana Lake
Memorandum (or Approval) Date: January 16, 2014
Design Exception Request Date: October 22, 2013
Region: Fort McMurray
Approval Status: Approved

## Summary

According to AT HGDG - Design Bulletin 70/2010, for new rural divided highway cross-sections, where the land is considered to be lower value, a 55 m centerline (CL) spacing is considered desirable and a 40 m minimum CL is considered acceptable. The design exception request is for a 25 m CL median separation from station $33+011$ to $37+176$.

## Rationale for Approval/Rejection

- The economic benefit/cost analysis comparison undertaken by the consultant between a 55 m and 25 m CL median separation indicates the 25 m CL separation is considered more cost effective than the 55 m CL median separation.
- According to the consultant, there is a capital cost savings of approximately $\$ 11.58 \mathrm{M}$ due to the separation between the existing west pipeline corridor and existing Highway 63 for this section of highway.
- There are no proposed median crossovers and/or intersections within the proposed 25 m median separation segment.
- High tension cable barriers (HTCB) although cost effective, will not be installed on the reduced median section at this time. The safety performance will be monitored by the region and HTCB can be installed in the future, if required. This is considered acceptable, as there are other highway sections in the Province which currently have narrower medians and/or are ranked higher in terms of HTCB installation priority.

## Additional Information

There were constraints associated with this project with the presence of a utility corridor on one side and a lake on the other side.

| Key Words |
| :--- |
| Reduced median spacing, cross-section, horizontal alignment |
